Recommendations App

- We used the Spotify API to help users find new music based off their specific tastes

- We ask for a variety of preferences to customize the perfect playlist for the user

- The questions include range from preferred danceability, preferred energy level, preferred speechiness (amount of lyrics compared to amount of instrumental), preferred tempo (in BPM), preferred valance (how happy or sad the song is).

- After inputting the preferences, the app will return new songs to checkout, with all the attributes within a close range of what was inputted
